 Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8% average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associative with a Phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Direct Submission

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associate with a Phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequencing vector: plasmid; n/a; 100% of reads

It currently consists of 7 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that has provided by the submittor.

```

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associate with a Phrap-derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319 Consensus quality: 128674 bases at least Q40 Consensus quality: 128674 bases at least Q20 Insert size: 150000; agarose-fp Insert size: 120154; sum-of-contigs Quality coverage: 10.78x in Q20 bases; agarose-fp Quality coverage: 10.78x in Q20 bases; sum-of-contig

NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces

\* is believed to be correct as given, however the sizes of the gaps between them are based on estimates that has provided by the submittor.

ON Nov 19, 2002 this sequence version replaced gi:23616728. The sequence in this assembly is a combination of BAC basec and whole genome shotgun sequencing reads assembled using ! (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig din the feature table below represents a scaffold in the Atlassembly (a 'contig-scaffold'). Within each contig-scaffold individual sequence contigs are ordered and oriented, and individual sequence contigs are ordered and oriented, and stand stand extend beyond the ends of the clone and there may be se Morley, K.C.

The sequence in this assembly is a combination of BAC base and whole genome shotgun sequencing reads assembled using, (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig din the feature table below represents a scaffold in the Acasembly (a 'contig-scaffold'), Within each contig-scaffold individual sequence contigs are ordered and oriented, and by sized gaps filled with Ns to the estimated size. The semmay extend beyond the ends of the clone and there may be scontigs within a contig-scaffold that consist entirely of genome shotgun sequence reads. Both end sequences and wholeshotgun sequence only contigs will be indicated in the fea

On May 10, 2003 this sequence version replaced gi:25188700 me sequence in this assembly is a combination of BAC base and whole genome shorgun sequencing reads assembled using (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig in the feature table below represents a scaffold in the Al assembly (a 'contigs ecaffold'). Within each contig contig individual sequence contigs are ordered and criented, and by sized gaps filled with Ns to the setimated size. The Sympy extend beyond the ends of the clone and there may be contigs within a contig-scaffold that consist entirely of genome shotgun sequence reads. Both end sequences and who shotgun sequence cands both the feature fable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rat Genome Sequencing Consortium.

\* NOTE: This is a 'working draft' sequence. It currently

\* consists of l contigs. Gaps between the contigs

\* are represented as runs of N. The order of the pieces

\* is believed to be correct as given, however the sizes

\* of the gaps between them are based on estimates that ha provided by the submittor.
This sequence will be replaced
by the finished sequence as soon as it is available and
the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least BX average
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Direct Submission

data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associate with a Phrap derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319

Consensus quality: 144765 bases at least Q30

Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that hav
                                                                                                                                                                                                                                                                                                                                                                                                                                    Quality coverage: 8.83x in Q20 bases, agarose-fp Quality coverage: 9.03x in Q20 bases; sum-of-contigs

data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g. human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 6X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associative a phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                unknown length

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associate with a Phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequencing vector: plasmid; n/a; 100% of reads
Sequencing vector: plasmid; n/a; 100% of reads

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that hav provided by the submittor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence will be replaced by the finished sequence as soon as it is available and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gap of unknown length contig of 37028 bp in length gap of unknown length contig of 2049 bp in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1. .149736 // Corganism="Felis catus" // Mol_type="genomic DNA" // db xref="ltaxon:9685" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" // clone="RP86-474H17" //

quence data in this record represents an 'enhanced' of a Phase 2 submission. Specifically, the indicated and orientation of each sequence contig has been ished using one or more of the following: read-pair com individual subclones, overlaps with neighboring alignment with available reference sequence (e.g., and/or confirmation by PCR testing. In addition, prence assembly is based on at least 8x average is in Q20 bases and has been reviewed to rule out hisassemblies, the low-quality ends of sequence is have been trimmed away, and each base is associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is a 'working draft' sequence. It currently ists of 12 contigs. Gaps between the contigs represented as runs of N. The order of the pieces plaved to be correct as given, however the sizes he gaps between them are based on estimates that have ided by the submittor.

Sequence will be replaced a cression number will be preserved.

Baylor Plaza, Houston, TX 77030, USA.

On Nov 13, 2002 this sequence version replaced gi:23267374.

The sequence in this assembly is a combination of BAC base and whole genome shorgun sequencing reads assembled using (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig (in the feature table below represents a scaffold in the At assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and by sized gaps filled with Ns to the estimated size. The semay extend beyond the ends of the clone and there may be contigs within a contig-scaffold that consist entirely of genome shocgun sequence reads. Both end sequences and who shotgun sequence only contigs will be indicated in the fee
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NOTE: Estimated insert size may differ from sequence lege http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_dorsists. This is a 'working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
